

House Price Prediction — Project Summary

Name: Anya Gupta

Date: 17 June 2026

Dataset: 545 houses with 13 features including area, bedrooms, bathrooms, stories, and amenities.

Key Findings:

The most influential features on house price are area, number of bathrooms, and air conditioning. Properties on main roads and in preferred areas also command higher prices.

Model Performance:

- Linear Regression — R^2 : 0.65, MAE: 9,70,043
- Random Forest — R^2 : 0.61, MAE: 10,21,546
- Linear Regression performed better on this dataset.

Surprise Finding:

Number of bedrooms had surprisingly little impact compared to bathrooms and total area.

Business Recommendation:

Real estate businesses should focus on marketing total area and bathroom count over bedroom count. Adding air conditioning and main road access can significantly boost resale value.
